The Bureau of Reclamation on Friday said it has increased its water releases from Navajo Dam — about 30 miles east of Farmington on the San Juan — from 650 cubic feet per second to 1,300 cfs to help dilute any river contaminants.

The agency also said the increased release also is intended to "alleviate concerns for endangered species and wildlife, while helping with other river issues."

"Releases from the dam will remain at 1,300 cfs through the weekend and will be re-evaluated on Monday," the bureau said in a news release.

Randy:

So this means when will it flow into Navajo Nation? Pretty imminently correct?

ASPECT just finished another flight. They are seeing discoloration below Farmington. The attached photo is showing the dilution from the San Juan (the flow is to the left)
